CAPABILITY CHOSEN — WORKFLOWS

FlowMind

Turn the prompts that non-technical Free users *already type into Claude* into reusable workflows and convert them to Pro along the way.

Blueprint is free; running workflows nudges users to Pro.

30M
estimated monthly active users

<1%
turn recurring prompts into workflows

The product bet

Claude should not wait for users to choose the right capabilities. It should reason about the user's intent and make the trade-off visible.

FIRSTHAND TEST · APRIL 17, 2026

So I tried to build one.

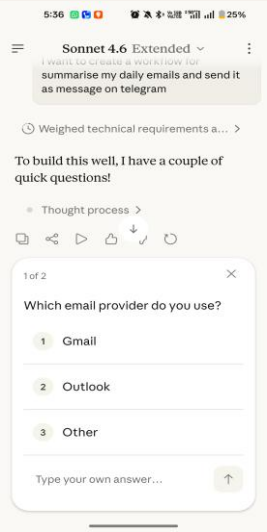

I tried to set up a workflow on the Claude free tier. Goal: summarise my daily emails and send them to Telegram.

STARTED STRONG

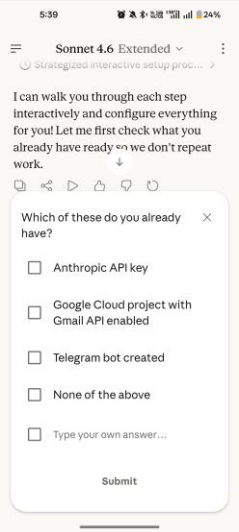

Steps were clear. Claude asked me the right questions.

GOT ENGAGED

It asked my email provider and how I wanted to run it. I felt this was going to work.

THEN THE SHIFT

It gave me a Python script and 6 setup steps. Google Cloud. OAuth. Cron jobs. I'm not a developer.

I ASKED FOR HELP

> ***"Can you do all above steps for me, ask me what ever is required"*** — me, 5:39pm, giving up

THE CORE BREAKDOWN

Where Claude stops being Claude.

WHAT CLAUDE DID WELL

- Captured what I wanted in plain language
- Asked the right follow-up questions
- Wrote the Python file
- Even warned me OAuth would be the tricky part

WHERE IT BROKE

- Handed me an Anthropic API key to copy-paste
- Sent me into Google Cloud Console to navigate ~12 screens
- Asked me to configure OAuth consent and download a JSON
- Expected me to write a cron job on my own machine

> *"It's like following an action plan with a script. Zapier gives you a connector. Claude gives you homework."*

THE PROBLEM

Users aren't stuck on *what* Claude can do → they're stuck on *what to keep doing*.

SURVEY · 21 PEOPLE

Only 3 of 21 use Claude's advanced features regularly

9 in 10 don't feel clear on how to structure a complex task

1 in 3 have abandoned a workflow mid-build

9 in 10 want AI that guides them

Google Form (11) + Typeform (10) responses from non-technical professionals.

REDDIT + REVIEW SITES

"I use AI daily but can't figure out what to do beyond chat."
— r/ClaudeAI

"Output format drifts between runs."
— r/ChatGPT

"I got hired to automate a company and have no idea where to start."
— r/zapier

PEER VALIDATION · echai

15 conversations. 4 unique signals.

"I wasn't aware Claude could do that."
— Chartered Accountant

"n8n is more user-friendly because you actually see what's being built."
— Enterprise SaaS Founder

eChai - Proof

COMPETITIVE

Zapier is the biggest name in this space.

Its own marketing frames AI Agents as **"80% accuracy sufficient"**
— not built for work that matters.

That's the bar we're clearing.

SYNTHESIS: *Three of four peer conversations validated FlowMind's core gaps. The fourth refined the segment by surfacing who FlowMind is **not** for — technical builders who want control over structure.*

People know what they want Claude to automate.

The Gap

They can't figure out how to get Claude to actually do it.

WHY "MORE CAPABILITIES" MAKES IT WORSE

Skills bundle prompts. Agents loop on tools. Workflows orchestrate runs. Each was built to remove a constraint together they create a new one: **choosing**.

Users default to chat because chat is the only path that doesn't ask them to pre-decide.

Result: Claude's most powerful surface (Workflows) is the least adopted, even by daily users.

HYPOTHESIS & EVIDENCE

Across 1,800+ public reviews and 21 user quotes on 5 platforms, the same gap shows up: *prompt → workflow*.

H1 ✓ validated

Intent-Translation Gap

80%

not "very clear" on structure

Users know the outcome. They can't architect the path.

H2 ✓ validated

Confidence Before Commitment

40%

have abandoned a workflow

They can't predict what'll work, what'll cost, or where it'll break. Uncertainty = abandonment.

H3 ✓ validated

Overwhelmed by feature choices

88%

default to prompting

Figuring out prompt vs workflow vs agent is expensive, so users don't bother.

H4 ~ partially

Handoff & Maintenance

Reddit

dominant theme

Users can't debug, maintain, or hand off workflows they built or inherited.

H5 ✓ validated

Stuck at the deployment phase

Field test

breakdown point

Claude designs well, writes the plan, the code, the follow-ups. Then hands you a script to execute yourself.

> "How do I actually automate this end-to-end workflow? Should I be looking into agents, APIs, or something else entirely?"

r/ClaudeAI · 3 weeks ago

> "I daily use AI but can't figure out what to do beyond chat. What's the main workflow you'd want to automate first?"

r/ClaudeAI · 5 days ago · 16 answers

> "I don't know how to code, so I used ChatGPT and a few no-code tools to build some simple workflows."

r/nocode · "5 small AI workflows" post

TARGET USER

The Chatter-Stuck daily Claude users who copy-paste their workflow every Monday.

Behavioural definition (not demographic): Free-plan Claude users, 22–28, Tier 1 Indian cities, non-technical (no IDE / API / scheduler experience), who re-pasted the same prompt ≥3 times in 30 days.

Claude	Daily · client research
Codes?	No · pastes ChatGPT scripts
Workflows	**0 shipped**

> "I don't know how to code, so I used ChatGPT and a few no-code tools to build some simple workflows."

r/nocode · "5 small AI workflows" post

Wedge sizing : math explicit

Est. TAM	~30M Claude
SAM	~6M Free · 22–28 · non-tech
Wedge (India Tier 1)	~750K Initial Target.
Target	37.5K shippers

~30M × ~70% Free × ~30% age 22–28 non-tech = ~6M global. 12.5% India share × 40% Tier 1 = 750K Initial Target.. 5% activation → 37.5K.

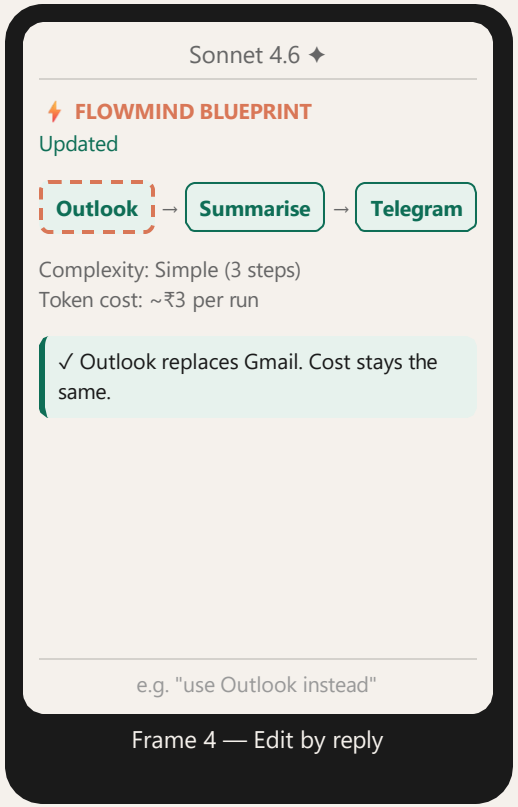

Why first? Largest pool · clearest pain · FlowMind *itself* becomes the Free→Pro upgrade hook.

MVP WIREFRAMES

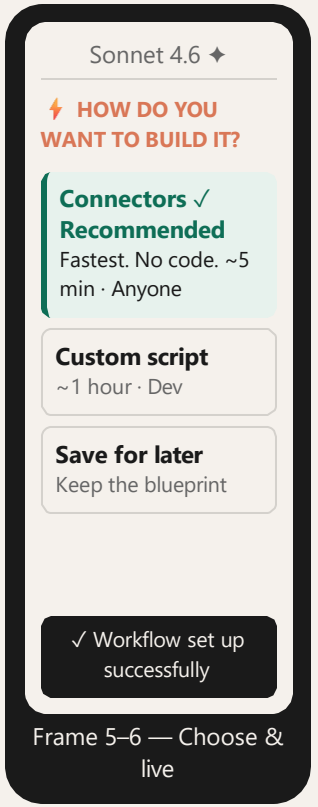

Detect → Visualize → Choose → Run, all inside chat six frames, three interactive screens.

Frame 2 — Nudge

Frame 4 — Edit by reply

Frame 5–6 — Choose & live

Walkthrough — what each frame teaches

Frame 2 · The nudge. The engine detects a recurring, workflow-shaped prompt and intervenes *before* the user wastes tokens on a standard chat response.

Frame 4 · The chat is the editor. "Use Outlook instead" regenerates the diagram. The AI calculates and visualizes the exact trade-offs (Token Cost vs. Complexity). Users no longer have to guess how their choices impact usage.

Frames 5–6 · Three honest paths. Connectors pre-selected (default-pick). Script & Save visible, not pushed. Success state lands back in chat.

Wireframe: Wireframe (Balsamiq) | SVG→

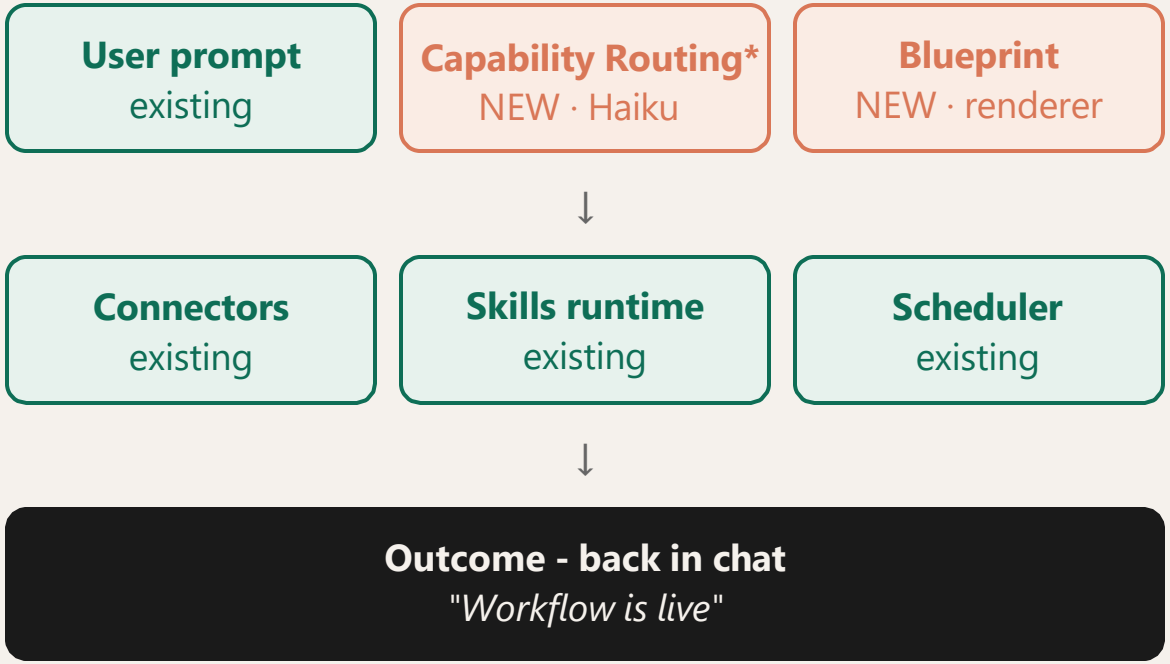

Live prototype: Lovable build prompt | Live URL →

Mocks above are in-deck recreations of the live Lovable prototype using the same Claude.ai design language (cream BG, coral accents, serif headings).

SYSTEM & USER JOURNEY

The chat is the editor: no new surface, just one classifier and one renderer on top of what Claude already ships.

Data flow: five existing pieces, two new

No new surface area = no new training cost for users, no new SDK for partners.

*Analyzes user prompt to determine: 1) Intent, 2) Required Capability (Agent vs Workflow), 3) User's technical constraints.

User journey: prompt to scheduled run in <5 minutes

Step	User does	Feels
1. Prompt	"Summarise daily emails, send to Telegram"	Routine
2. Nudge	Sees coral card, taps "Yes, set it up"	Curious: "this is just for me?"
3. Visualize	Sees 3 nodes + token cost, says "use Outlook instead"	In control: chat is still the editor
4. Choose	Picks Connectors (recommended, ~5 min)	Relieved: one decision, not three
5. Live	Sees "Runs daily at 8 AM" confirmation	Won: first workflow ever shipped

Key principle: Every step happens in the chat thread. No tab switch. No "open Workflow Studio." That's the whole product.

SUCCESS METRICS — KPI TREE

Lagging tells me if it worked. Leading tells me before it's too late.

NORTH STAR

Workflows-that-ship

per active user · per week

↓

ACTIVATION
Nudge → Blueprint

↓

- **Surfacing rate** — % eligible
- **Accept rate** — tap "Yes"

BUILD
Blueprint → Run

↓

- **Connectors %** — low-friction
- **Script %** — dev path

RETENTION
Repeat-run rate

↓

- **Run success** — no failures
- **Edit-after** — iteration

REVENUE
Free → Pro conversion

↓

- **Paywall accept** — Connectors gate
- **Pro retention** — 90-day churn

GUARDRAILS — DO NOT TRADE

False-positive nudge · Token-cost accuracy · Interruption complaints · OAuth failures

MONEY · DISTRIBUTION · RISKS

The blueprint makes the upgrade decision concrete.

MONEY

The blueprint is shown before the paywall.

The *thinking* is free: detect, visualize, save the blueprint, even use the custom-script path.

Pro unlocks running: Connectors path + scheduled runs. Free users see their own workflow *before* they see the price.

The upgrade ask lands warm, not cold.

Target: ~3% Free → Pro on blueprint-viewers

DISTRIBUTION

Distribution starts inside Claude.

1. In-product nudge. Every Free user typing a workflow-shaped prompt sees FlowMind. Zero CAC. The blueprint *itself* is the conversion event.

2. India Tier 1 social loop. Sharable templates seeded with creators (e.g. *Daily news brief → WhatsApp*).

Not a channel: paid acquisition. Free users won't repay CAC.

RISKS

Three things could break it.

Paywall friction. Users hit Pro gate and bounce.
→ 1 free Connectors run before gate.

Trust break. Wrong-shape detection.
→ "Not now" + free-text override always visible; weekly FP log.

Annoyance. Over-nudging = noise.
→ Cap 1 nudge / 24h; threshold raises after 3 dismissals.

The kill criterion: *If the leading signals on slide 8 don't move within 60 days, sunset and reinvest in Skills discovery instead.* **Decision-help, not capability-help.**

WRAP UP

How we'd know it worked.

1 The one number that matters

People who see a FlowMind suggestion and actually *build the workflow*. Not "engagement." Not "views." Did they ship the thing or not.

2 The one thing we have to watch

Too many suggestions = noise = dismissed = product dead. One nudge per relevant prompt. Three dismissals → quiet for 24 hours. A wrong-capability rate above 10% kills trust.

3 What I'd do next

Continue peer validation with new audiences (technical builders, finance ops). A clickable prototype of Detect + Visualize. A conversation with Anthropic's Workflows team about real technical constraints.

FlowMind in one line: detect, visualize, choose.
If it works, Claude becomes the place non-tech users build — not the place they prompt.
